Parallel Parking - Test Standards, Revision 3

1. Purpose

This document sets the standards examiners apply to the parallel parking manoeuvre on the Northfield test circuit. Candidates should practise the manoeuvre until it is smooth and controlled.

2. Approach

Drive towards the parking bay at a steady speed. Approach the parked car at no more than 20 km/h.

Switch on the left indicator before you stop alongside the parked car.

Stop with your car level with the parked car, about half a metre to one metre away from it.

3. Reversing into the bay

Select reverse gear and check all round, looking over both shoulders before you move.

Reverse at walking pace. Your speed must not exceed 4 km/h while reversing.

Do not reverse more than 10 m from where you stopped alongside the parked car.

4. Steering

Steer fully to the left when the rear of your car is level with the rear of the parked car. Straighten the wheels at about 45 degrees, then steer fully to the right to bring the front in.

The car must never be more than 55 degrees to the kerb at any point while reversing.

5. Finishing position

The car must finish parallel to the kerb, within 3 degrees.

Apply the handbrake before you release the foot brake.

Cancel the indicator once the car is parked.

A good finishing position is normally about 30 cm from the kerb.

6. Assessment

The examiner may stop the test at any time if the manoeuvre becomes unsafe.
